Thm 4.2: The altitudes of a triangle are concurrent at a point called the orthocenter (H). The triangle formed by joining the midpoints of the sides of  $\triangle ABC$  is called the medial triangle of  $\triangle ABC$ . The sides of the medial triangle are parallel to the original sides of the triangle.

A tangent to a circle is a line which intersects the circle at only one point. Given a circle  $O(A)$ , the tangent to a circle at  $A$  is the perpendicular to the radius  $OA$  at  $A$ .  $A O A O B M P$ . If  $P$  is a point outside a circle  $(O)$ , there are two lines through  $P$  tangent to the circle.
